# Instructional Practice with Guides

In the Student Book, the Instructional Practice provides students with 30 practice questions similar in scope and structure to the actual questions in Sessions 1 and 2. In this Teacher Guide, there are guides that the teacher can provide for the student to help them solve each problem.

1            A            8.F.3

**Guide:** Think about the exponent of  $x$ .

2            C            8.EE.6

**Guide:** Substitute the values of the known point into the equation  $y = mx + b$  to find the  $y$ -intercept.

3            B            8.G.7

**Guide:** Use the Pythagorean Theorem,  $a^2 + b^2 = c^2$  to find the missing side.

4            B            8.EE.1

**Guide:** The fraction line is a grouping symbol. Subtract the exponents to simplify the fraction.

5            D            8.F.2

**Guide:** Use  $y = mx + b$  to find the slope and  $y$ -intercept of Function A. For Function B, use rise/run to find the slope and look at the graph to find the  $y$ -intercept.

6            B            8.SP.1

**Guide:** A negative correlation is one in which both variables are decreasing. A strong correlation exists when the data points are very close together.

7            A            8.G.9

**Guide:** Solve using the formula  $\frac{4}{3}\pi r^3$ .

8            A            8.F.4

**Guide:** Use the slope formula to find the slope of the line. Then use  $y = mx + b$  to find the  $y$ -intercept.

9

8.NS.1

Answers:  $\frac{2}{3}$ , 1.5, -9,  $\sqrt{81}$

**Guide:** A rational number is any number that can be expressed as a fraction where the denominator is not zero.

- 10 **Show Your Work:** Distance from  $(-2, 1)$  to  $(-2, 9)$  is 8 units. Distance from  $(-8, 1)$  to  $(-2, 1)$  is 6 units.  $8^2 + 6^2 = 64 + 36 = 100$ . The square root of 100 is 10, so the length of the hypotenuse is 10 units.

The distance between the points  $(-8, 1)$  and  $(-2, 9)$  is 10 units.

**Guide:** Use the Pythagorean Theorem to find the distance between the two points by forming a right triangle with those points as the vertices.

8.G.8

- 11 **Linear Equations:**  $4y = 3x$  or  $99x + 12 = 23y$

8.F.3

**Guide:** A linear equation is one that forms a straight line on a graph. Nonlinear equations do not form a straight line.

- 12 **Possible Reason:** This equation can be written in  $y = mx + b$  form or form a straight line when graphed.

8.F.3

- 13 **Nonlinear Equation:**  $y = x^2 + 3x - 9$

8.F.3

- 14 **Possible Reason:** This equation cannot be written in  $y = mx + b$  form because the  $x$  has an exponent of two.

8.F.3
